

The screenshot shows a web browser window with the URL `testng.org/doc/documentation-main.html`. The page displays the TestNG documentation, specifically the section on annotations. The following table summarizes the visible content:

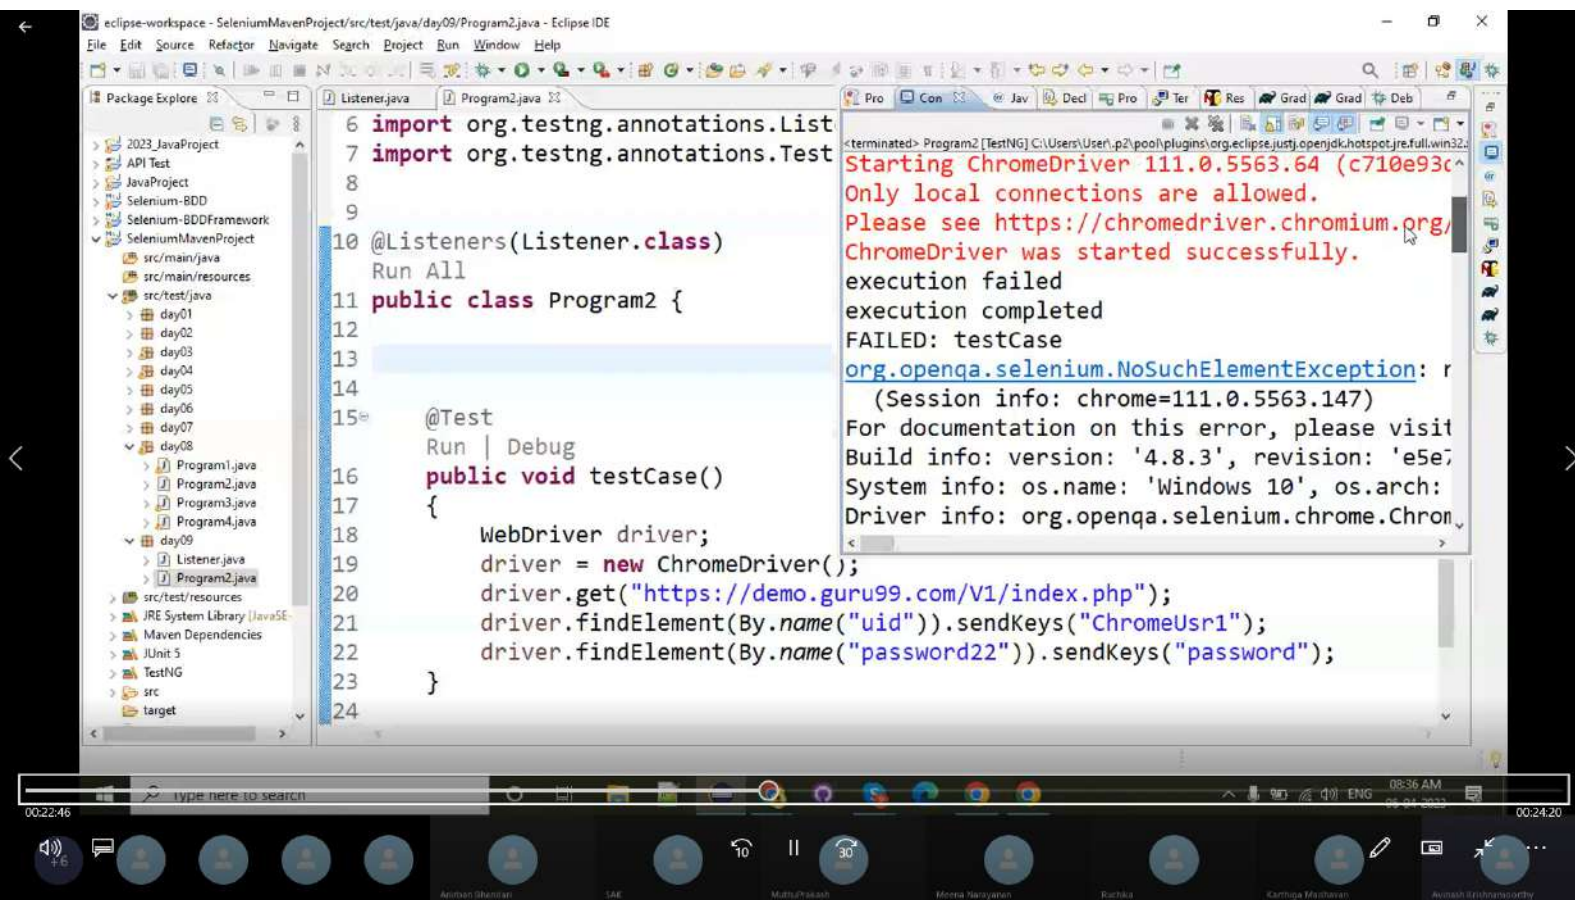

Annotation	Description
<code>dependsOnGroups</code>	The list of groups this method depends on.
<code>dependsOnMethods</code>	The list of methods this method depends on.
<code>enabled</code>	Whether methods on this class/method are enabled.
<code>groups</code>	The list of groups this class/method belongs to.
<code>inheritGroups</code>	If true, this method will belong to groups specified in the <code>@Test</code> annotation at the class level.
<code>onlyForGroups</code>	Only for <code>@BeforeMethod</code> and <code>@AfterMethod</code> . If specified, then this <code>setup/teardown</code> method will only be invoked if the corresponding test method belongs to the specified groups.
<code>@DataProvider</code>	Marks a method as supplying data for a test method. The annotated method must return an <code>Object[][]</code> where each <code>Object[]</code> can be a data provider. A method that wants to receive data from this <code>DataProvider</code> needs to use a <code>dataProvider</code> name equals to the name of this annotation.
<code>name</code>	The name of this data provider. If it's not supplied, the name of this data provider will automatically be set to the name of the method.
<code>parallel</code>	If set to true, tests generated using this data provider are run in parallel. Default value is false.
<code>@Factory</code>	Marks a method as a factory that returns objects that will be used by TestNG as Test classes. The method must return <code>Object[]</code> .
<code>@Listeners</code>	Defines listeners on a test class.
<code>value</code>	An array of classes that extend <code>org.testng.ITestNGListener</code> .
<code>@Parameters</code>	Describes how to pass parameters to a <code>@Test</code> method.
<code>value</code>	The list of variables used to fill the parameters of this method.
<code>@Test</code>	Marks a class or a method as part of the test.
<code>alwaysRun</code>	If set to true, this test method will always be run even if it depends on a method that failed.
<code>dataProvider</code>	The name of the data provider for this test method.
<code>dataProviderClass</code>	The class where to look for the data provider. If not specified, the data provider will be looked on the class of the current test method or one of its base classes. If this attribute is specified, the data provider method needs to be static on the specified class.
<code>dependsOnGroups</code>	The list of groups this method depends on.
<code>dependsOnMethods</code>	The list of methods this method depends on.
<code>description</code>	The description for this method.
<code>enabled</code>	Whether methods on this class/method are enabled.
<code>expectedExceptions</code>	The list of exceptions that a test method is expected to throw. If no exception or a different than one on this list is thrown, this test will be marked a failure.
<code>groups</code>	The list of groups this class/method belongs to.
